... logging into postgres has had some problems with various versions of prelude. The author has not been able to get these issues resolved and have therefore taken the approach of logging to /tmp/test_server.log instead of the specified log file. 30 newtype RowVersion = RowVersion[newtype OnError a = OnError a newtype OnSuccess a = OnSuccess a The nice thing about prelude is that you can avoid a lot of boilerplate, and only specify the things that matter to your application. Finally, there is a 'library' subpackage that is the actual prelude package itself. With the following command you can see the contents of that package ./clay/clay --file /tmp/prelude.cabal function above :: Char -> Bool -- show hidden functions And there it is. This is a very terse and powerful DSL for describing the interface of your library, and also how to preprocess and compile it. With these two things, you can add a new kind of function or operator to prelude that does not change the behaviour of existing ones, and is not mentioned in the types. I've been doing Haskell for many years, but have also dabbled in Lisp for a bit, mostly Common Lisp. Now, I am really looking forward to getting started with Haskell again and taking advantage of all this wonderful power. Hello. How do you evaluate this code, that does not compile? As I mentioned in the blog, I was working on a project which was built around this pattern. I'm taking this opportunity to tell the story about this and make sure that you don't get stuck like I did. In my case, I had a CLI application, which implemented most of the functionality of a server and a client. The server and the client were two separate applications, that the user of the application could run separately from the main application. Each one of these clients, talked to the main server via an RMI interface. RMI is a technology that allows you to use the object oriented principles of your object-oriented languages to communicate across the network. It is implemented on top of shared memory on the server and client computers, so it is not a network protocol, but a low-level communication protocol. The main server implements 82157476af
